#### The Male Condom - what is it and how do we use it?

A condom works by covering a man's penis with a very thin sheet of latex. This means the man can still feel everything going on but his sperm can't get inside the woman. If a man's penis isn't actually touching the woman because it is covered, then this also means that either person can't catch a STI off the other one. So, if used properly, condoms are very safe methods of contraception suitable for any couple who wants to prevent pregnancy, or any straight or gay couple who want to prevent STIs.

Contrary to popular belief, condoms do not break easily. You just need to ensure it is put it on carefully and make sure there's no air bubble at the end of it. During sex, be careful of sharp nails, jewellery or teeth, in case of rips.

If the condom won't roll down, it's the wrong way round. This means you must throw it away and use a new one (if you now used it the correct way round you risk bacteria which could cause STIs transferring).

Condoms are also available at all chemists or your local family planning center (for free). The only real con is that they can be fiddly to put on and it is possible for them to slide off or tear. Used with care, condoms can be up to 98% effective against pregnancy.

Never use a condom more than once and always check the use-before date on the wrapper.
